

Proof keeps the reserve.

Cross-chain infrastructure for issuing and redeeming assets
against cryptographically verified reserves.

“Backed” is usually just a promise.

01

Hidden reserves

Token holders cannot independently confirm that the claimed backing was actually locked.

02

Unsafe minting

A cross-chain transaction alone does not prove the right vault, asset, recipient or amount.

03

Missing exits

Many prototypes demonstrate issuance but never prove reserve payout and token burning.

Every mint begins with proof. Every burn ends with settlement.

Resyvr turns cross-chain evidence into enforceable token-supply rules.

Two chains. One verifiable lifecycle.

ETHEREUM SEPOLIA

Canonical reserve vault

Locks test USDC and emits uniquely identified deposit and payout events.

ATTESTCOIN

Cryptographic proof

Proves the transaction, receipt, event fields and attested block continuity.

CREDITCOIN CC3

Issuer controller

Checks provenance and replay identities, then mints, escrows or burns.

Canonical vault provenance

Exact amount binding

Four replay guards

Isolated issuers

One wallet. Every asset.

An issuer creates a branded, redeemable ERC-20 system, returns later to mint more of the same asset, and manages every token from one portfolio.

- ✓ Guided cross-chain wallet flow
- ✓ Refresh-safe transaction recovery
- ✓ Public explorer links at every step

The investor exit is proven too.

1

Request

Holder escrows tokens on Creditcoin.

2

Pay

Vault sends the exact reserve amount to the named recipient.

3

Prove

Attestcoin proves the successful Sepolia payout.

4

Burn

Creditcoin finalizes redemption and destroys the escrowed supply.

RESERVE AFTER

0.0 USDC

SUPPLY AFTER

0 rvUSD2

✓ SETTLED

Inspectable. Reproducible. Live.

[Open the Judge Evidence page ↗](#)

RWA infrastructure judges can verify.

Built for issuers

Canonical vaults, isolated asset systems,
repeat minting and complete redemption.

Built for scrutiny

Every address, transaction, proof result
and final accounting state is public.

Honest boundaries

Test assets, attestation delay, issuer
liveness, and an activation stake that is
explicitly not insurance.
